## Features

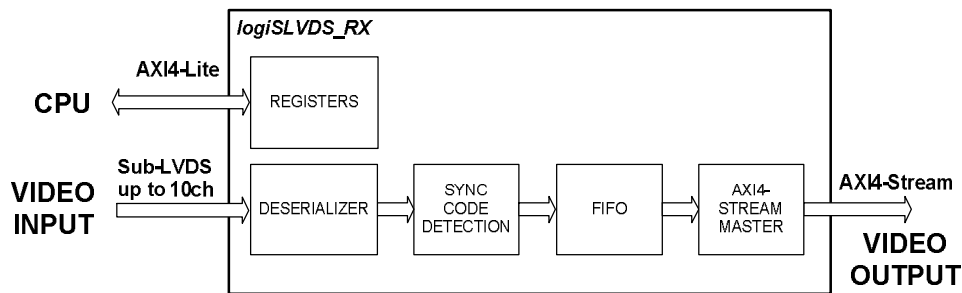

- Supports Xilinx® Zynq®-7000 All Programmable SoC and 7 Series FPGAs
- Enables easy interfacing of Ultra HD CMOS image sensors to Xilinx All Programmable devices
- Supports Sub-LVDS interface and recognizes major Sony® IMX image sensor sync codes
- Fully compatible with the Sony IMX274 and IMX317 (8 MP) CMOS image sensors
- Can be adapted to other sensors with the Sub-LVDS interface and for the latest Xilinx devices
- Supported number of bus lanes: 4, 6, and 10
- Maximum input video resolution and frame rate are limited by the targeted FPGA family
- Validated with the Ultra High-Definition 4K2Kp60 (3840x2160@60fps) video inputs
- Supports Raw Bayer 10-bit video input and 8-bit or 10-bit video output
- Enables parallel processing of 1, 2 or 4 pixels per clock
- Generates HSYNC, VSYNC and Reset signals for image sensors
- Video output is ARM® AMBA® AXI4-Stream protocol compliant
- Supports marking of two different exposures in the High-Dynamic Range (HDR) video input
- Configuration registers are AMBA AXI4-Lite protocol compliant
- Can be evaluated on Xylon logiUVK kit as a part of the 4K2K HDR UltraHD video pipeline reference design
- Prepackaged for Xilinx Vivado® Design Suite and fully controllable through the IP Integrator GUI interface
- Xylon assures maintenance and technical support

Core Facts	
Provided with Core	
Documentation	Datasheet
Design File Formats	Encrypted VHDL
Constraints Files	Reference design constraint files
Verification/Validation	Simulated and HW validated
Reference Designs & Application Notes	logiREF-VIDEO-HDR-ISP reference design for the Xylon logiUVK kit
Additional Items	logiUVK HDR UltraHD Video Kit
Supported Simulation Tools	
Mentor Graphics ModelSim® and QuestaSim® Aldec Active-HDL™ and Riviera-PRO™	
Support	
Support provided by Xylon	

**Table 1: Example Implementation Statistics for Xilinx® FPGAs**

Family (Device)	Fmax (MHz)		LUT	FF	IOB	RAMB36	RAMB18	DSP48	PLL/MMCM	BUFG/BUFR	Design Tools
	aclk	s_axi_clk									
Artix®-7 (XC7A100T-1)	200	250	2449	3426	25	0	10	0	0	1	Vivado 2015.4
Kintex®-7 (XC7K325T-3)	350	300	2448	3426	25	0	10	0	0	1	Vivado 2015.4

- 1) Assuming typical configuration: 10ch input, 288 MHz Sub-LVDS clock (DDR), 10bpc, Bayer input and output, 4 pix/clock, AXI4-Lite interface
- 2) Implementation statistics given for the Artix-7 and the Kintex-7 FPGAs are valid for the Zynq-7000 All Programmable SoC family
- 3) Implementation statistics can vary depending on implementation tool options, related FPGA design logic, device speed grade...

**Figure 1: logiSLVDS\_RX Architecture**

## Applications

Application fields include Surveillance, Automotive Driver Assist, Machine Vision, Video Conferencing, Digital Signage, Medical Imaging, Aerospace and Defense, and others.

## General Description

The logiSLVDS\_RX IP core from the Xylon logicBRICKS IP library enables easy interfacing of ultra high resolution Sony CMOS image sensors to image signal processing pipelines and application processors implemented in Xilinx All Programmable devices. Xylon supports IP modifications and adaption for other image sensors through design services.

High speed data transfers are supported by the Sub-LVDS differential interface, which is a reduced voltage form of LVDS signaling. The IP core can be configured to support up to 10 interface lanes (differential pairs). It performs data deserialization, recognizes camera sync codes, optionally generates HSYNC and VSYNC signals required by the sensor, buffers pixels to decouple image sensor and the internal SoC bus, and outputs the video data packaged in compliance to the AXI4-Stream interface. The logiSLVDS\_RX can also mark two different exposure video lines when used with HDR image sensors. In order to support the highest possible input video resolutions, the logiSLVDS\_RX IP core can be configured for parallel processing of 2 or 4 pixels per clock.

**Figure 2: logiUVK Kit in the Transportation Case (not included with the kit)**

The logiSLVDS\_RX IP core is AMBA AXI4 bus protocol compliant and can be smoothly integrated with other Xylon logicBRICKS, Xilinx or third-party IP cores. The logiSLVDS\_RX video output interface conforms to the AXI4-Stream video protocol and assures low-latency video processing with no need for the external video frame

buffering. An AXI4-Lite compliant registers interface assures high flexibility and enables processor to control the logiSLVDS\_RX through registers.

The logiSLVDS\_RX IP core is well suited for use with the logiISP Image Signal Processing (ISP) Pipeline and the logiHDR High Dynamic Range (HDR) Pipeline IP cores. Xylon advanced ISP pipelines support many image processing capabilities, such as removal of defective pixels, de-mosaicking of Bayer encoded video, image color and gamma corrections, advanced noise filtering, video analytics used for control algorithms like Auto White Balance and Auto Exposure, video data formats and color domains conversions, merging of different exposures for HDR enabled sensors and other HDR video enhancements.

All Xylon logicBRICKS IP cores are prepackaged for Xilinx Vivado IP Integrator (IPI) tool. They require no skills beyond general tools knowledge and can be used in same ways as Xilinx IP cores. Video system designers can easily setup the logicBRICKS IP cores, including the logiSLVDS\_RX IP core, by setting up all IP core's parameters through an easy-to-use IPI GUI interface.

The logiSLVDS\_RX and other Xylon image signal processing IP cores can be fully evaluated on the logiUVK HDR UltraHD Video Kit (Figure 2). To learn more about this development kit, please visit:

<http://www.logicbricks.com/Products/logiUVK.aspx>

## Functional Description

The Figure 1 presents internal logiSLVDS\_RX architecture. The logiSLVDS\_RX performs deserialization of the input LVDS lines. The deserialized data is buffered in FIFOs in order to compensate for differences in the data rates of the input and the output stages of the IP core. The buffered video data is read by the AXI4-Stream block that packets the output video data.

## Core Modifications

The core is supplied in an encrypted VHDL format compatible with the Xilinx Vivado IP Integrator. Many logiSLVDS\_RX configuration parameters are selectable prior to VHDL code synthesis, and the following table presents a selection from a list of the available parameters:

**Table 2: logiISP VHDL Configuration Parameters**

Parameter	Description
C_NUM_CH	Number of Sub-LVDS lanes: 4, 6, 10
C_HS_PERIOD	Default period of HSYNC signal, in number of ref_clk_in clock periods
C_VS_PERIOD	Default period of VSYNC signal, in number of HSYNC signal periods
C_COUNTER_WIDTH	HSYNC and VSYNC counters width
C_USE_HDR	Enable detection of different exposures in the input video data
C_MAX_SAMPLES_PER_CLOCK	Pixels per clock: 1, 2, 4
C_AXIS_DATA_WIDTH	Output pixel width: 8, 10

The logiSLVDS\_RX is designed with regard to adaptability to various sensors. However, there may be instances where source code modification is necessary. Therefore, if you wish to adopt the logiSLVDS\_RX core to your specific needs and/or to supplement the IP core's features set, you can allow us to tailor the logiSLVDS\_RX to your requirements.

## Core I/O Signals

The core I/O signals have not been fixed to any specific device pins to provide flexibility for interfacing with user logic. Descriptions of all I/O signals are provided in Table 3.

**Table 3: Core I/O Signals**

Signal	Signal Direction	Description
<b>Streaming Video Interface</b>		
AXI4-Stream Video Master Interface	Bus	Refer to Xilinx AXI Reference Guide
<b>Control Interface</b>		
AXI4-Lite Slave Interface	Bus	Refer to Xilinx AXI Reference Guide
<b>Clock and Reset Signals</b>		
ref_clk_in	Input	Sensor clock, input to the receiver
io_clk_in_p	Input	Differential clock input (p) from the sensor
io_clk_in_n	Input	Differential clock input (n) from the sensor
io_clk_out	Output	Clock output from the deserializer
aclk	Input	AXI4-Stream clock, shared between all streaming interfaces
aresetn	Input	AXI4-Stream reset, active low, shared between all streaming interfaces
s_axi_aclk	Input	AXI4-Lite clock
s_axi_aresetn	Input	AXI4-Lite reset, active low
<b>Sub-LVDS Interface</b>		
io_data_in_p	Input	Differential data input (p) from sensor
io_data_in_n	Input	Differential data input (n) from sensor
<b>Sensor Control Interface</b>		
io_xvs	Output	Sensor VSYNC signal
io_xhs	Output	Sensor HSYNC signal
io_xclr	Output	Sensor reset signal

## Verification Methods

The logiSLVDS\_RX is fully supported by the Xilinx Vivado Design Suite. This tight integration tremendously shortens IP integration and verification. A full logiSLVDS\_RX implementation does not require any particular skills beyond general Xilinx tools knowledge.

Learn more about the logiSLVDS\_RX from:

URL: [http://www.logicbricks.com/Products/logiSLVDS\\_RX.aspx](http://www.logicbricks.com/Products/logiSLVDS_RX.aspx)

## Recommended Design Experience

The user should have experience in the following areas:

- Xilinx design tools
- Camera systems

## Available Support Products

Xylon provides the logiREF-VIDEO-HDR-ISP free pre-verified reference design to showcase the logiSLVDS\_RX IP core and Xylon ISP pipelines on the Xilinx Zynq-7000 AP SoC based logiUVK HDR UltraHD Video Kit. The reference design contains everything you need to immediately start evaluating and working with the Xylon logiSLVDS\_RX: the SoC design including evaluation logicBRICKS IP cores, hardware design files, documentation and the GUI-based demo application (Linux OS):
